

# Deal Desk Agent

**From laptop to production - governed.**

An autonomous pricing-approval agent on UiPath Maestro BPMN.

Track 2: Maestro BPMN

Built with coding agents (Cursor + Claude)

Runs on Automation Cloud

# Pricing approvals: 100% human-touched, mostly for nothing

- Every discount / renewal change is routed to a human - even the trivial ones
- Approval thresholds live in people's heads and drift between managers
- No SLA, so deals stall in inboxes; no audit trail, so compliance is guesswork

## Slow

inbox ping-pong

## Inconsistent

tribal thresholds

## Invisible

no audit trail

# An agent for judgment. Maestro for the lifecycle.

## AGENT (LangGraph)

Decides WHAT should happen

Disposition + risk score

Recommendation + rationale

Sizes the approver chain as  
data

## MAESTRO BPMN

Runs HOW it happens

Cards, human gate, SLA timer

Iterates the agent's chain

Audit on every path

# The agent: a Python LangGraph coded agent, 3 entry points

**plan**

score · disposition · draft · size chain

**render**

contextual Outlook Adaptive Card

**process\_response**

interpret reply · decide next action

## Decision logic (from code)

```
risk = min(1.0, 0.5·discount/25% + 0.5·value/$500k)  
auto_clear: <=5% AND <=$50k | >25% adds Director+VP | >$500k adds CFO | bad payload -> exception
```

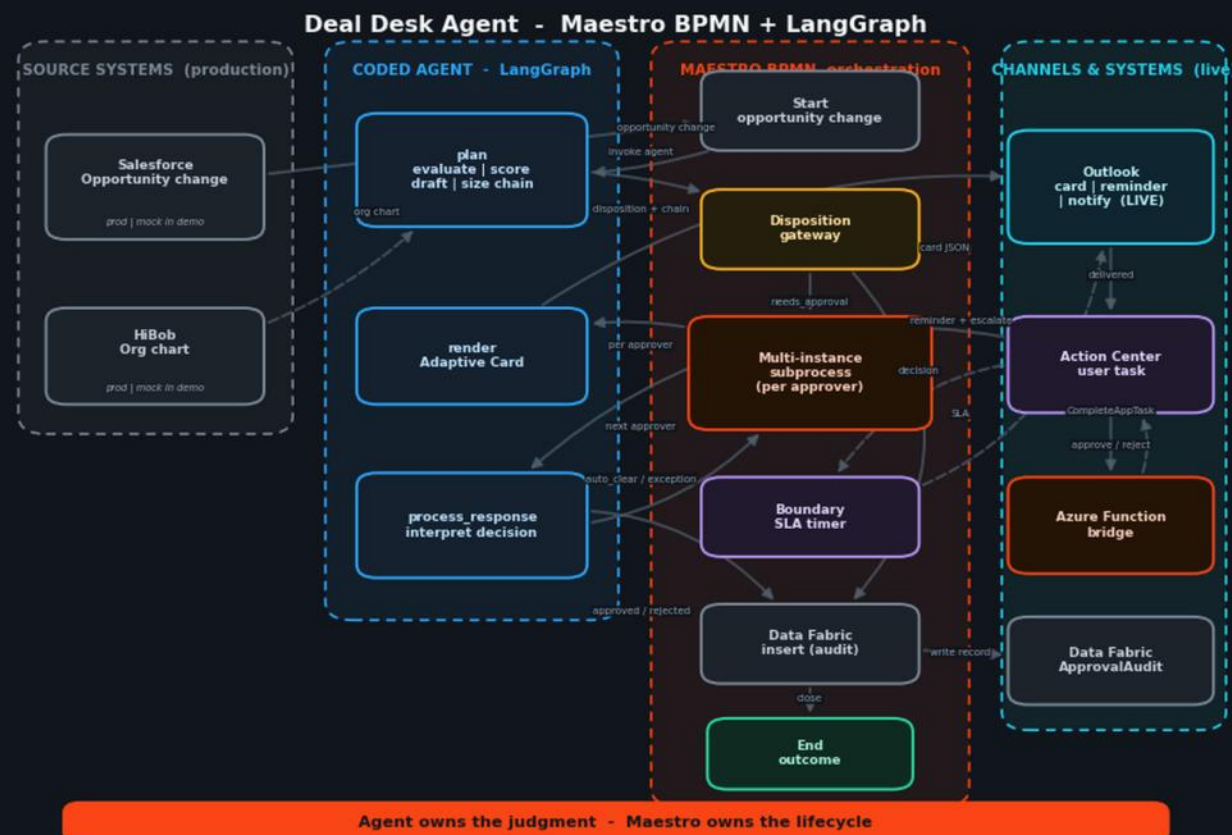

# One Maestro BPMN process - the right actor for each step

- Sequential multi-instance subprocess iterates the agent-produced approver chain - 1 manager or a 4-tier CFO deal, no branch explosion
- Boundary SLA timer escalates; requester is notified; Data Fabric logs every outcome

# The whole flow - explore it

Salesforce + HiBob -> LangGraph agent -> Maestro BPMN -> Outlook / Action Center / Azure bridge / Data Fabric

# Three paths, one process - decided by the agent

## 1 Auto-clear

$\leq 5\%$  /  $\leq \$50k$

zero cards

logged & closed

## 2 One manager

8% / \$40k

one Outlook card

Approve -> done

## 3 Multi-tier

30% / \$1.2M

mgr -> dir -> VP

-> CFO, in order

# Built by coding agents

**Natural language -> coding agents -> governed cloud process**

- Coding agents generated/edited the LangGraph agent, the BPMN, bindings, schema exports, and the Data Fabric entity
- Low-code Maestro + pro-code agent combined - the combination UiPath flagged as especially interesting
- This IS the laptop -> production bridge: prompts became a deployed, governed process

# Governance & human-in-the-loop

---

## Human gate

Action Center task

Azure bridge resumes

the instance

## Time governance

Boundary SLA timer

reminder +

escalation

## Audit

Data Fabric logs

agent rec vs.

human decision

## Guardrails

bad payload ->

exception; empty

chain -> fallback

# Runs on Automation Cloud - not a laptop demo

---

- Coded agent published to the tenant feed; 3 entry points deployed as runnable processes
  - BPMN validated (UiPath extensions + full diagram DI); live Outlook connection bound
  - Full solution packaged as a deployable .uipx (agent + BPMN + Data Fabric ApprovalAudit)
  - Unit tests passing: disposition, auto-clear, multi-tier, schema, guardrails, rendering
- UiPath is the orchestration + governance layer that ties it together.**

# Business impact & reach

---

## Deflection

low-risk deals  
clear with zero  
human touch

## Speed + consistency

SLA + routing  
replace inbox  
ping-pong

## Auditability

every decision  
logged for compliance  
& tuning

## Portable

invoice · expense ·  
onboarding  
(Track 2 examples)

# Decide. Draft. Route. Audit.

**Autonomously - and shipped to production.**

Agent owns the judgment · Maestro owns the lifecycle · UiPath owns governance
