

Deal Desk Agent

Your AI Deal Desk Analyst

UiPath AgentHack. Build the AI agents of tomorrow.

Track 2: UiPath Maestro BPMN

Coding-agent bonus: Cursor + Claude via UiPath for Coding Agents

Daniela Rosenstein

Builder @ Cato Networks

Coded Agents (LangGraph)

plan / render / process_response

Maestro BPMN

orchestration + sequential approval loop

WaitDecision Robot

RPA: 3 channels + Persistence wait

Problem statement and proposed solution

Problem

- Every sales org has a Deal Desk: the team that reviews pricing exceptions,

emails managers up the chain, waits for replies, consolidates decisions,

and updates the CRM. It is manual, inbox-driven, and slow.

- No SLA: deals stall in inboxes for days.
- No consistency: routing thresholds drift between managers.
- No audit trail: decisions buried in email threads.

Solution

- The Deal Desk Agent does that job, end to end on Automation Cloud:

1. Live Salesforce data via AgentHub MCP; approver chain from the org chart.
2. Risk scoring + LLM rationale -> recommendation and disposition.
3. Low-risk deals auto-approve with zero human touch.
4. WaitDecision Robot reaches each approver on 3 channels at once: Outlook Adaptive Card + Slack DM + Action Center 'wait for task'.
5. AWS Lambda HITL bridge mints a token; any channel resolves the wait.
6. process_response interprets decisions; rejection short-circuits the chain.
7. Slack + Outlook summary to the AE; Data Fabric ApprovalAudit record.

Benefits and technologies used

End users	Renewals analysts, AEs, deal-desk approvers
Department	Sales / Revenue Operations + Finance
Industries	Any B2B org with renewals & pricing exceptions
UiPath products	Maestro BPMN, Coded Agents, Action Center, Data Fabric, RPA, Integration Service, AgentHub MCP
Integrations / tech	Salesforce, Outlook Adaptive Cards, Slack, AWS Lambda + CloudFront, LangGraph

Benefits, impact and outcomes

- For the Opportunity Owner (AE):
 - No chasing managers: agent routes, robot sends, BPMN tracks.
 - Slack DM + Outlook summary with the full decision trail at the end.
 - Low-risk deals ($\leq 5\%$ / $\leq \$50k$) clear with ZERO human touch.

For the business:

- Consistent policy applied identically via the risk-score formula.
- Rejection short-circuits the chain (no wasted approver time).
- Data Fabric logs the agent recommendation vs. each human decision.

Solution architecture

Salesforce opportunity change starts the Maestro BPMN.

plan agent: live Salesforce (AgentHub MCP) + org chart

-> risk score + LLM rationale + approver chain

Disposition gateway:

auto_approve -> Slack + Outlook, audit (zero touch)

needs_approval -> sequential approver loop:

render -> WaitDecision Robot fires 3 channels

(Outlook Adaptive Card + Slack + Action Center)

AWS Lambda HITL bridge mints token; Persistence wait

any channel resolves; rejection short-circuits

process_response interprets the decisions

-> Slack + Outlook summary -> Data Fabric ApprovalAudit

Three demo scenarios

Live test results - Jun 22 2026 (all channels verified):

TEST-001: GlobalTech \$120k/18% -> Approve (within policy)

TEST-002: MegaCorp \$350k/32% -> Approve with conditions (escalation)

TEST-003: StartupXYZ \$28k/45% -> Reject (margin impact too high)

TEST-004: Pharma \$780k/22% -> Approve (enterprise, Finance pre-approved)

Outlook Adaptive Card | Slack DM | Action Center - all verified

Scenario 1 - Auto-approve (4% / \$30k): zero human touches.

Scenario 2 - One approver (8% / \$40k): Adaptive Card + Slack to Manager.

Scenario 3 - Full chain (30% / \$1.2M): four sequential approvers; rejection

short-circuits; full Data Fabric audit trail.

THANK you.

Every Deal Desk should work like this.

Collect. Reason. Route. Sign-off. Audit. Automatically.

Track 2: Maestro BPMN | Coding-agent bonus | Runs on
Automation Cloud
